

# UX Review

Based on 11 Nov, 3pm Staging

| Section  | Item                        | Current state/ experience  | Amendment  |
|----------|-----------------------------|--|--|
| Overall  | Save & Delete button        | Delete button is on the right of Save button   | Move Save button to the right of Delete button   |
|          | Typo errors in page editing | Errors are highlighted instead of underlined   | Change to the normal pattern of underlined instead of highlighting   |
| Homepage | Site notification section   | Unclear how to remove element  | Change copy to “Leave text field empty if you don’t need this notification bar”  |
|          | Hero section                | Unable to leave fields empty if unneeded, get error message “Title should be longer than 2 characters” and save button is disabled | Should have same behaviour as above: If field is left empty, field should be removed and layout adapts   |
|          | Infobar and infopic panels  | Only Hero section allows button name to be empty   | Make Infobar and Infopic behaviour for button name the same<br><br>Basically all fields that are left empty can be assumed that users don’t need them -> should not force users to insert content when they don't have content |
|          | Button fields               | Users can currently have a button name but no button URL   | Show an error to prompt users to fill in a URL, so that button isn’t dead  |
|          | Prompt to save              | No warning when exiting the homepage about unsaved changes, modal only appears on normal pages                                     | Apply same behaviour throughout to the homepage  |
|          | Section card                | Clickable area to collapse section is very small, only around the chevron  | Increase click area to the entire right side of the card, after text   |

|                  |  |   |   |
|------------------|--|---|---|
| <b>Settings</b>  | Save button                                  | Save button is below the fold, making it hard to find   | Pin save button to bottom of screen, same UI as in a normal page        |
| <b>Resources</b> | Create new folder in Resource Settings modal | Have to hit enter or click the 'create <foldername>' dropdown to create the new folder -> not super intuitive for now | Add a visual prompt for users to click on the dropdown -> maybe an icon |
|                  | Select file button in modal                  | Not functioning right now   | Fix the bug   |
|                  | Resource Settings modal                      | Modal size change we try to fill in the date  | Standardise modal size if possible.                                     |
